Control soil erosion ▶

A Vancouver company, Deltalok Inc., has devised a unique mechanism that interlocks soil bags, making them practical as both soft and hard armour applications. The Deltalok Standard Unit is used around the world for erosion control, retaining walls and environmental restoration. Unlike reinforced concrete walls, pre-cast concrete panels, and concrete blocks, Deltalok soil bags can vegetate and produce a visually pleasing, natural green finish.

The Deltalok System is made of a tough, lightweight plastic and is rectangular. Strategically positioned claws on the top and bottom grab soil bags as they are stacked in a "delta" (pyramid) formation, interlocking" conventional soil bags.
